What is the default output voltage for a rectifier?

The rectifier default factory output voltage is 53.5V. - Once power is applied to the rectifier and the rectifier is recognized by the controller, the output voltage is updated to the setting programmed into the controller.

How do you calculate a bridge rectifier output voltage?

The following steps outline how to calculate the Bridge Rectifier Output Voltage. First, determine the input AC voltage ( $V_{rms}$ ) supplied to the bridge rectifier. Next, consider the typical forward voltage drop across each diode ( $V_d$ ), which is usually around 0.7V for silicon diodes.

What is a rectifier voltage?

The rectifier voltage represents the DC output of a rectifier circuit before any filtering or regulation. It's crucial for determining the efficiency and suitability of a rectifier for a given application. How does the peak voltage affect the rectifier voltage?
